

Accessibility Tool Findings

I used the Silktide Accessibility Checker on my Summer Sale webpage and the Canvas website.

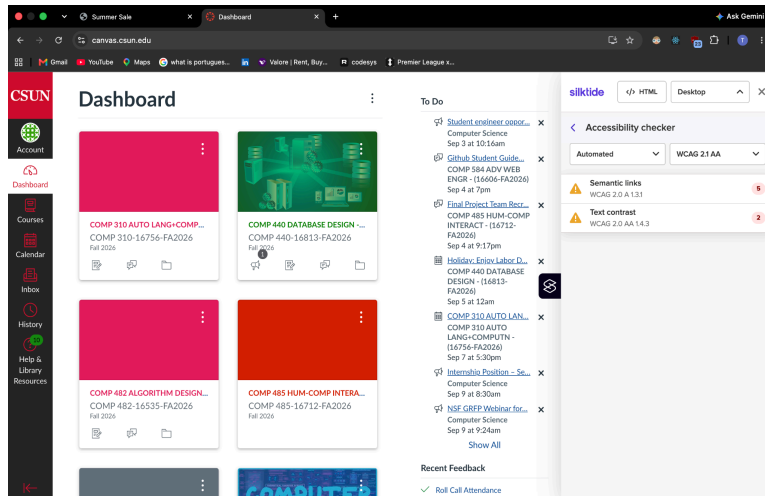

Summer Sale Results

Silktide found one semantic-links warning involving the table layout. The email uses tables for layout because tables have better support across different email programs. The tables include `role="presentation"` to help screen readers understand that they are being used for design rather than data.

Canvas Results

Silktide found five semantic-link warnings and two text-contrast issues on Canvas.

Pros and Cons

One benefit of SilkTide is that it is easy to use and clearly shows where accessibility problems appear. It also explains which accessibility guideline is connected to each problem. One disadvantage is that the results can be confusing without knowing accessibility terminology. Automated testing also cannot identify every possible accessibility problem.
